ALDEN NETMASTER DISH

The reception area shown here is based on the official footprint supplied by the satellite operator, results gained by testing the equipment ourselves and reports from other users. It should be used as a guide only as a satellite's footprint can change at any time and without warning.

HELLASAT: The blue area on this map shows the area in which the Alden Netmaster can access the Internet.

For the area in which it can receive TV channels from Astra and Eurobird satellites, please refer to the footprint map of the Alden 85cm Orbiter.
Please note that the reception area for Astra and Eurobird satellites will not be quite as good as with a standard Alden 90cm system. This is because the L.N.B. used for receiving TV signals cannot be positioned totallly accurately as the L.N.B. for the Internet service takes priority.
